AWS CloudTrail — Important Interview Questions & Answers

1.What is AWS CloudTrail?
AWS CloudTrail is an AWS service that records and tracks API activity and actions performed in an AWS account. It helps us monitor who performed an action, what action was performed, and when it happened.
Simple ga gurthupettuko:
CloudTrail ante AWS account lo evaru em action chesaru, eppudu chesaru ani record chese service.
Eng: CloudTrail records and tracks API activity in an AWS account.

2.What is Event History?
Event History is the CloudTrail section that provides a searchable record of recent AWS account activity. It helps us view events such as who performed an action, what action was performed, and when it happened.
Simple ga gurthupettuko:
Event History ante recent AWS activities and API actions chuse place.
Eng: Event History shows recent AWS account activity.

3.What is a CloudTrail Trail?
A Trail is a configuration that delivers CloudTrail events to a destination such as an S3 bucket. It can be used to continuously record and store AWS activity for auditing and analysis.
Simple ga gurthupettuko:
Trail ante CloudTrail events ni continuously record chesi S3 lo store cheyyadaniki use chese configuration.
Eng: A Trail records CloudTrail events and delivers them to a destination such as S3.

4.What are Management Events?
Management Events record management operations performed on AWS resources, such as creating, modifying, or deleting resources. They are also called control plane operations.
Simple ga gurthupettuko:
Management Events ante AWS resources ni create, modify, delete chesina control plane actions.
Eng: Management Events record control plane operations on AWS resources.

5.What are Data Events?
Data Events record operations performed on or within a resource, such as object-level actions in an S3 bucket or function-level actions in Lambda. They are also called data plane operations.
Simple ga gurthupettuko:
Data Events ante resource lopala jarige detailed data operations ni record chestayi.
Eng: Data Events record data plane operations on supported AWS resources.

6.What is the difference between Management Events and Data Events?
Management Events record control plane actions such as creating or modifying resources, while Data Events record data plane actions such as accessing objects in S3.
Simple ga gurthupettuko:
Management Events resource management actions kosam, Data Events resource data actions kosam.
Eng: Management Events record control plane actions, while Data Events record data plane actions.

7.What is CloudTrail Insights?
CloudTrail Insights helps identify unusual API activity and patterns that may indicate unexpected behavior. It can help detect unusual spikes or changes in API call activity.
Simple ga gurthupettuko:
CloudTrail Insights ante unusual API activity ni identify cheyyadaniki use chestham.
Eng: CloudTrail Insights helps identify unusual API activity.

8.Where are CloudTrail Logs stored?
CloudTrail events can be delivered to an S3 bucket for long-term storage and auditing. CloudTrail can also send events to other supported AWS services for monitoring and processing.
Simple ga gurthupettuko:
CloudTrail logs ni long-term storage and auditing kosam S3 lo store cheyyachu.
Eng: CloudTrail events can be stored in an S3 bucket for auditing.

9.Why do we use AWS CloudTrail?
We use CloudTrail for auditing, security monitoring, troubleshooting, and tracking activities performed in an AWS account. It helps us understand who performed an action and when it happened.
Simple ga gurthupettuko:
AWS account lo activities track, audit, and troubleshoot cheyyadaniki CloudTrail use chestham.
Eng: CloudTrail is used for auditing, monitoring, and tracking AWS activities.

10.What information does CloudTrail record?
CloudTrail can record information such as the identity that made the request, the action performed, the resource involved, the time of the event, and other request details.
Simple ga gurthupettuko:
CloudTrail evaru, em action, ye resource meeda, eppudu ani information record chestundi.
Eng: CloudTrail records who performed an action, what action was performed, and when it happened.

11.Can CloudTrail track who deleted an EC2 instance?
Yes. CloudTrail can record the API call used to terminate an EC2 instance. We can check the event details to identify the user or role that performed the action and when it happened.
Simple ga gurthupettuko:
EC2 terminate chesindi evaro CloudTrail event lo check cheyyachu.
Eng: CloudTrail can show who performed the API call to terminate an EC2 instance.

12.Can CloudTrail track who deleted an S3 object?
Yes. When S3 data events are enabled for the required bucket, CloudTrail can record object-level actions such as object deletion.
Simple ga gurthupettuko:
S3 object delete chesindi evaro telusukovali ante S3 Data Events enable cheyyali.
Eng: CloudTrail can track S3 object deletion when the required Data Events are enabled.

13.What is the difference between CloudTrail and CloudWatch?
CloudTrail is mainly used to record API activity and AWS account actions, while CloudWatch is mainly used to monitor metrics, logs, alarms, and application or resource performance.
Simple ga gurthupettuko:
CloudTrail activities and API calls kosam, CloudWatch monitoring and metrics kosam use chestham.
Eng: CloudTrail tracks API activity, while CloudWatch monitors resources and applications.

14.What is the difference between CloudTrail and VPC Flow Logs?
CloudTrail records AWS API activity and account actions, while VPC Flow Logs record information about network traffic flowing through VPC network interfaces.
Simple ga gurthupettuko:
CloudTrail AWS API activities kosam, VPC Flow Logs network traffic kosam.
Eng: CloudTrail records API activity, while VPC Flow Logs record network traffic information.

15.How would you check who deleted an AWS resource?
I would open CloudTrail and search the event history for the delete or terminate API action. Then I would check the event details to identify the user or role, time, resource, and source of the request.
Simple ga gurthupettuko:
Resource delete ayite CloudTrail Event History lo delete API call search chesi user or role check chestham.
Eng: I would use CloudTrail to identify who performed the delete API action.

16.How would you troubleshoot an unexpected AWS resource change?
I would check CloudTrail Event History for the API call related to the resource change. I would review the identity, time, action, resource, and request details to understand what happened.
Simple ga gurthupettuko:
Unexpected change vaste CloudTrail lo related API call and user details check chestham.
Eng: I would use CloudTrail to identify the API activity that caused the resource change.

17.Why should we store CloudTrail logs in S3?
We can store CloudTrail logs in S3 for long-term retention, auditing, investigation, and compliance requirements. S3 provides durable storage for these logs.
Simple ga gurthupettuko:
CloudTrail logs ni long-term audit and investigation kosam S3 lo store chestham.
Eng: CloudTrail logs can be stored in S3 for long-term auditing and investigation.

18.What is the most important thing to remember about AWS CloudTrail?
AWS CloudTrail is mainly used to record and track API activity in an AWS account. The important concepts are Event History, Trails, Management Events, Data Events, Insights, and Log Storage.
Simple ga gurthupettuko:
CloudTrail ante AWS account lo evaru em API action chesaru ani track and audit cheyyadaniki use chese service.
Eng: CloudTrail records and tracks API activity for auditing and monitoring.
