## AWS SQS — Important Interview Questions & Answers

1.What is Amazon SQS?
Amazon SQS is a fully managed messaging service in AWS used to store messages in a queue.
It helps applications communicate with each other without needing to be available at the same time.
Simple ga gurthupettuko:
SQS ante AWS lo messages ni queue lo store chesi applications madhya communication ki use chese service.
Eng: SQS is a managed service used to store and deliver messages through queues.

---

2.What is an SQS Queue?
An SQS Queue is a temporary storage location where messages are stored until a consumer processes them.
It helps applications send and receive messages asynchronously.
Simple ga gurthupettuko:
Queue ante applications process cheyyadaniki messages temporary ga store ayye place.
Eng: An SQS Queue stores messages until they are processed by a consumer.

---

3.What is a Standard Queue?
A Standard Queue provides high throughput and supports a very large number of messages.
It provides at-least-once message delivery, so duplicate messages can sometimes be received.
Simple ga gurthupettuko:
Standard Queue ante high throughput kosam use chese queue, duplicate messages ravachu.
Eng: A Standard Queue provides high throughput but may deliver duplicate messages.

---

4.What is a FIFO Queue?
FIFO stands for First-In-First-Out.
A FIFO Queue is used when message order and exactly-once processing are important.
Simple ga gurthupettuko:
FIFO Queue ante messages order maintain cheyyali ante use chese queue.
Eng: A FIFO Queue maintains message order and supports exactly-once processing.

---

5.What is the difference between Standard and FIFO Queue?
A Standard Queue provides higher throughput but does not guarantee strict message ordering.
A FIFO Queue maintains message order and is used when ordered processing is required.
Simple ga gurthupettuko:
Standard Queue high throughput kosam, FIFO Queue message order kosam use chestham.
Eng: Standard Queue focuses on high throughput, while FIFO Queue maintains message order.

---

6.What is Visibility Timeout in SQS?
Visibility Timeout is the time during which a message becomes invisible after a consumer receives it.
It prevents other consumers from processing the same message at the same time.
Simple ga gurthupettuko:
Visibility Timeout ante consumer message process chesthunna time lo vere consumer ki message kanipinchakunda undadam.
Eng: Visibility Timeout temporarily hides a message after it is received.

---

7.Why do we use Visibility Timeout?
We use Visibility Timeout to prevent multiple consumers from processing the same message at the same time.
If the consumer does not delete the message within the timeout, it can become visible again.
Simple ga gurthupettuko:
Same message multiple times process avvakunda Visibility Timeout use chestham.
Eng: Visibility Timeout helps prevent multiple consumers from processing the same message simultaneously.

---

8.What is a Dead-Letter Queue?
A Dead-Letter Queue is an SQS queue used to store messages that cannot be successfully processed.
It helps us identify and troubleshoot messages that repeatedly fail.
Simple ga gurthupettuko:
Dead-Letter Queue ante repeatedly process avvani failed messages ni store chese queue.
Eng: A Dead-Letter Queue stores messages that repeatedly fail processing.

---

9.What is Message Retention in SQS?
Message Retention defines how long SQS keeps a message in a queue before automatically deleting it.
The retention period can be configured based on the application requirement.
Simple ga gurthupettuko:
Message Retention ante queue lo message entha time store avvali ani define cheyyadam.
Eng: Message Retention defines how long a message stays in an SQS queue.

---

10.How does SQS work?
A producer sends a message to an SQS queue.
A consumer receives and processes the message, and after successful processing, the message is deleted from the queue.
Simple ga gurthupettuko:
Producer → SQS Queue → Consumer → Process → Delete.
Eng: A producer sends a message to SQS, and a consumer processes and deletes it.

11.What is a Producer in SQS?
A Producer is an application or service that sends messages to an SQS queue.
It sends information that needs to be processed by another application or service.
Simple ga gurthupettuko:
Producer ante SQS Queue ki message send chese application or service.
Eng: A Producer is an application or service that sends messages to SQS.

---

12.What is a Consumer in SQS?
A Consumer is an application or service that receives and processes messages from an SQS queue.
After successful processing, it usually deletes the message from the queue.
Simple ga gurthupettuko:
Consumer ante SQS Queue nundi message receive chesi process chese application.
Eng: A Consumer receives and processes messages from an SQS queue.

---

13.What happens if a consumer does not delete a message?
If the consumer receives a message but does not delete it, the message becomes visible again after the Visibility Timeout.
Another consumer can then receive and process the message.
Simple ga gurthupettuko:
Message delete cheyyakapothe Visibility Timeout tarvata malli queue lo visible avtundi.
Eng: If a message is not deleted, it becomes visible again after the Visibility Timeout.

---

14.How is SQS different from SNS?
SQS is mainly used to store messages in a queue until consumers process them.
SNS is mainly used to publish and distribute messages to multiple subscribers.
Simple ga gurthupettuko:
SQS messages ni queue lo store chestundi, SNS messages ni subscribers ki distribute chestundi.
Eng: SQS stores messages, while SNS distributes messages to subscribers.

---

15.How would you troubleshoot an SQS message processing issue?
I would check the queue status, message visibility timeout, consumer application, IAM permissions, Dead-Letter Queue, and CloudWatch logs.
I would also check whether messages are being deleted successfully after processing.
Simple ga gurthupettuko:
SQS problem vaste Queue → Visibility Timeout → Consumer → IAM → DLQ → Logs check chestham.
Eng: I would check the queue, timeout, consumer, permissions, DLQ, and logs.

---

16.What is the most important thing to remember about SQS?
SQS is mainly used to store and process messages between applications asynchronously.
The important concepts are Queues, Standard Queue, FIFO Queue, Visibility Timeout, Dead-Letter Queue, and Message Retention.
Simple ga gurthupettuko:
SQS ante applications madhya messages ni safely queue lo store chesi process cheyyadaniki use chese AWS service.
Eng: SQS is used to store and process messages between applications asynchronously.

---
