Amazon RDS — Important Interview Questions & Answers

1.What is RDS Dashboard?
RDS Dashboard provides an overview of your Amazon RDS resources and activities. It helps you quickly view the status and important information about your RDS environment.
Simple ga gurthupettuko:
Dashboard ante RDS lo overall status and information chuse place.
Eng: RDS Dashboard provides an overview of RDS resources.

2.What are Databases?
Databases section shows the RDS databases created in your AWS account. You can select an individual database to view its details.
Simple ga gurthupettuko:
Databases ante create chesina RDS databases anni chuse place.
Eng: Databases shows the RDS databases in your AWS account.

3.What is an Individual DB?
Individual DB page shows the complete details of a specific RDS database. It contains sections such as Connectivity & Security, Monitoring, Logs & Events, Configuration, Maintenance, and Backup.
Simple ga gurthupettuko:
Individual DB ante oka specific database ki complete details chuse place.
Eng: Individual DB shows the complete details of a specific RDS database.

4.What is Connectivity & Security?
Connectivity & Security shows how the RDS database can be accessed and secured. It includes information such as endpoint, port, VPC, subnet, security groups, and related connectivity settings.
Simple ga gurthupettuko:
Connectivity & Security ante DB ki ela connect avvali and security ela undi ani chuse place.
Eng: Connectivity & Security shows database connectivity and security settings.

5.What is Monitoring?
Monitoring shows the performance and health metrics of the RDS database. It helps you monitor CPU, memory, storage, connections, and other database metrics.
Simple ga gurthupettuko:
Monitoring ante DB performance and health ni check cheyyadam.
Eng: Monitoring shows the performance and health of the RDS database.

6.What is Logs & Events?
Logs & Events shows database logs and important events related to the RDS instance. It helps in troubleshooting and understanding what is happening with the database.
Simple ga gurthupettuko:
Logs & Events ante DB logs and important events chuse place.
Eng: Logs & Events shows database logs and events.

7.What is Configuration?
Configuration shows the configuration details of the RDS database. It includes settings related to the database engine, instance, storage, networking, and other configurations.
Simple ga gurthupettuko:
Configuration ante DB ela configure chesamo chuse place.
Eng: Configuration shows the configuration details of the RDS database.

8.What is Maintenance?
Maintenance shows maintenance-related information and settings for the RDS database. It includes maintenance windows and other maintenance activities.
Simple ga gurthupettuko:
Maintenance ante DB maintenance details chuse place.
Eng: Maintenance shows maintenance-related information for the RDS database.

9.What is Backup?
Backup shows backup-related information for the RDS database. It includes automated backup settings and backup information.
Simple ga gurthupettuko:

Backup ante DB backups ki sambandhinchina details chuse place.
Eng: Backup shows backup-related information for the RDS database.

10.What is Performance Insights?
Performance Insights helps monitor and analyze database performance. It helps identify database load and performance issues.
Simple ga gurthupettuko:
Performance Insights ante DB performance problems ni identify cheyyadaniki use chestam.
Eng: Performance Insights helps analyze database performance.

11.What are Snapshots?
Snapshots are point-in-time backups of an RDS database. They can be used to restore or create a database from a specific point in time.
Simple ga gurthupettuko:
Snapshot ante DB yokka point-in-time backup.
Eng: A Snapshot is a point-in-time backup of an RDS database.

12.What are Automated Backups?
Automated Backups are backups automatically created by Amazon RDS. They can be used for point-in-time recovery during the configured retention period.
Simple ga gurthupettuko:
Automated Backup ante AWS automatic ga create chese DB backup.
Eng: Automated Backups are automatically created by Amazon RDS.

13.What are Reserved Instances?
Reserved Instances provide a pricing option where you commit to using certain RDS instance capacity for a period of time. They can help reduce costs compared with On-Demand pricing.
Simple ga gurthupettuko:
Reserved Instance ante long-term commitment tho RDS cost ni reduce chesukune option.
Eng: Reserved Instances can help reduce RDS costs with a commitment.

14.What is RDS Proxy?
RDS Proxy is a fully managed database proxy that helps manage and pool database connections. It can improve application scalability and database connection management.
Simple ga gurthupettuko:
RDS Proxy ante application and DB madhya connection ni manage chese service.
Eng: RDS Proxy manages and pools database connections.

15.What are Subnet Groups?
A DB Subnet Group is a collection of subnets that can be used by an RDS database. It helps RDS place the database within the VPC networking environment.
Simple ga gurthupettuko:
Subnet Group ante RDS DB kosam use ayye subnets collection.
Eng: A DB Subnet Group is a collection of subnets used by RDS.

16.What are Parameter Groups?
Parameter Groups contain database engine configuration parameters. They allow you to customize database settings for RDS databases.
Simple ga gurthupettuko:
Parameter Group ante DB configuration parameters ni manage chese group.
Eng: Parameter Groups contain database configuration parameters.

17.What are Option Groups?
Option Groups provide additional features and options for supported RDS database engines. They are used to configure engine-specific options.
Simple ga gurthupettuko:
Option Group ante DB engine ki additional options/features configure cheyyadaniki use chestam.
Eng: Option Groups configure additional options for supported database engines.

18.What are Events?
Events show important changes or activities related to RDS resources. They can help you monitor and troubleshoot RDS activities.
Simple ga gurthupettuko:

Events ante RDS lo jarigina important activities or changes.
Eng: Events show important activities and changes in RDS.

19.What are Event Subscriptions?
Event Subscriptions allow you to receive notifications about specific RDS events. You can configure notifications for selected RDS resources and event categories.
Simple ga gurthupettuko:
Event Subscription ante specific RDS events ki notifications receive cheyyadam.
Eng: Event Subscriptions send notifications for selected RDS events.

20.What are Recommendations?
Recommendations provide suggestions to improve your RDS resources. They can help identify areas related to performance, security, reliability, or cost.
Simple ga gurthupettuko:
Recommendations ante RDS ni better ga manage cheyyadaniki AWS suggestions.
Eng: Recommendations provide suggestions to improve RDS resources.

21.What are Blue/Green Deployments?
Blue/Green Deployments help make database changes with reduced risk and downtime. They provide a separate environment where changes can be tested before switching production traffic.
Simple ga gurthupettuko:
Blue/Green ante changes ni separate environment lo test chesi production ki switch cheyyadam.
Eng: Blue/Green Deployments help test database changes before switching production.

22.What are Zero-ETL Integrations?
Zero-ETL Integrations help make data available between supported AWS services with minimal traditional ETL pipeline management. They are designed to simplify near real-time data integration between supported services.
Simple ga gurthupettuko:
Zero-ETL ante traditional ETL pipeline ekkuva manage cheyyakunda data integrate cheyyadam.
Eng: Zero-ETL Integrations simplify data integration between supported AWS services.

23.What is the most important thing to remember about RDS Console?
RDS Console provides different sections to create, manage, monitor, secure, and maintain RDS databases. Each section is used for a specific database management task.
Simple ga gurthupettuko:
RDS Console ante DB ni create, manage, monitor, secure, maintain cheyyadaniki use ayye place.
Eng: RDS Console is used to create, manage, monitor, secure, and maintain RDS databases.
