Amazon CloudWatch — Important Interview Questions & Answers

1.What is Amazon CloudWatch?
Amazon CloudWatch is an AWS monitoring and observability service used to monitor resources, applications, and services. It collects metrics, logs, and events and helps us identify performance and operational issues.
Simple ga gurthupettuko:
CloudWatch ante AWS resources and applications ni monitor cheyyadaniki use chese service.
Eng: CloudWatch is an AWS monitoring and observability service.

2.What is a CloudWatch Dashboard?
A CloudWatch Dashboard provides a visual view of metrics and monitoring information in one place. It helps us quickly understand the health and performance of our AWS resources.
Simple ga gurthupettuko:
Dashboard ante important metrics ni one place lo visual ga chuse place.
Eng: A CloudWatch Dashboard provides a visual view of monitoring information.

3.What is a CloudWatch Metric?
A CloudWatch Metric is a time-ordered set of data points used to measure the performance or behavior of AWS resources and applications. Examples include CPU utilization, network traffic, and request count.
Simple ga gurthupettuko:
Metric ante resource performance ni measure chese data.
Eng: A CloudWatch Metric is data used to measure resource performance.

4.What is a CloudWatch Alarm?
A CloudWatch Alarm monitors a metric and performs an action when the metric reaches a configured threshold. It can send notifications or trigger actions such as Auto Scaling.
Simple ga gurthupettuko:
Alarm ante metric threshold reach ayite action or notification trigger chese feature.
Eng: A CloudWatch Alarm triggers an action when a metric reaches a threshold.

5.What is a Log Group?
A Log Group is a collection of related log streams in CloudWatch Logs. It is used to organize and manage logs from applications and AWS resources.
Simple ga gurthupettuko:
Log Group ante related logs ni organize chese container.
Eng: A Log Group is a collection of related log streams.

6.What is a Log Stream?
A Log Stream is a sequence of log events from the same source. It is used to separate and organize log data inside a Log Group.
Simple ga gurthupettuko:
Log Stream ante oka source nundi vachina logs sequence.
Eng: A Log Stream is a sequence of log events from a single source.

7.What is CloudWatch Logs Insights?
CloudWatch Logs Insights is a feature used to search, analyze, and query log data stored in CloudWatch Logs. It helps us quickly find errors and troubleshoot application issues.
Simple ga gurthupettuko:
Logs Insights ante CloudWatch logs ni query chesi problems find cheyyadaniki use chestham.
Eng: Logs Insights is used to query and analyze CloudWatch log data.

8.What is CloudWatch Synthetics?
CloudWatch Synthetics allows us to create canaries that automatically check applications, APIs, URLs, and endpoints. It helps detect availability and performance issues before users report them.
Simple ga gurthupettuko:
Synthetics ante application or website ni automatic ga check chese canaries.
Eng: CloudWatch Synthetics uses canaries to monitor applications and endpoints.

9.What are CloudWatch Application Signals?
Application Signals helps monitor application performance and health by providing visibility into important application metrics and service performance. It helps identify application performance issues.
Simple ga gurthupettuko:

Application Signals ante application performance and health ni monitor cheyyadaniki use chestham.
Eng: Application Signals helps monitor application performance and health.

10.What is CloudWatch Network Monitoring?
CloudWatch Network Monitoring helps monitor network connectivity, availability, and performance. It can help identify network-related problems affecting applications and resources.
Simple ga gurthupettuko:
Network Monitoring ante network connectivity and performance problems ni identify cheyyadaniki use chestham.
Eng: CloudWatch Network Monitoring helps identify network connectivity and performance issues.

11.What are CloudWatch Settings?
CloudWatch Settings contain configuration options related to CloudWatch monitoring and features. These settings help manage how monitoring information and related features are configured.
Simple ga gurthupettuko:
Settings ante CloudWatch monitoring ki sambandhinchina configurations manage chese place.
Eng: CloudWatch Settings contain configuration options for CloudWatch features.

12.What is the difference between Metrics and Logs?
Metrics are numerical data points used to measure resource or application performance. Logs contain detailed records of events and activities generated by applications and resources.
Simple ga gurthupettuko:
Metrics numbers form lo performance data, Logs detailed event information.
Eng: Metrics are numerical performance data, while Logs contain detailed event information.

13.What is the difference between Log Group and Log Stream?
A Log Group is a container that organizes related log streams, while a Log Stream contains log events from a specific source.
Simple ga gurthupettuko:
Log Group logs ni organize chestundi, Log Stream specific source logs ni contain chestundi.
Eng: A Log Group contains log streams, while a Log Stream contains log events from a source.

14.What is a CloudWatch Namespace?
A CloudWatch Namespace is a container used to organize related CloudWatch metrics. AWS services publish their metrics under specific namespaces.
Simple ga gurthupettuko:
Namespace ante related metrics ni organize chese container.
Eng: A CloudWatch Namespace organizes related CloudWatch metrics.

15.What is a CloudWatch Threshold?
A threshold is a value used by a CloudWatch Alarm to determine when an action or notification should occur. For example, an alarm can be configured when CPU utilization goes above a specific percentage.
Simple ga gurthupettuko:
Threshold ante alarm trigger avvadaniki set chese value.
Eng: A threshold is a value used to trigger a CloudWatch Alarm.

16.How does CloudWatch help with EC2 monitoring?
CloudWatch collects EC2 metrics such as CPU utilization, network traffic, and status information. We can use these metrics to monitor performance and create alarms when required.
Simple ga gurthupettuko:
CloudWatch EC2 performance metrics ni collect chesi monitoring and alerts kosam use chestham.
Eng: CloudWatch monitors EC2 performance using metrics and alarms.

17.How can CloudWatch trigger Auto Scaling?
We can create a CloudWatch Alarm based on a metric such as CPU utilization. When the alarm reaches the configured condition, it can trigger an Auto Scaling action.
Simple ga gurthupettuko:
CloudWatch Alarm threshold reach ayite Auto Scaling action trigger cheyyachu.
Eng: A CloudWatch Alarm can trigger Auto Scaling based on a metric.

18.How can CloudWatch help in troubleshooting?
CloudWatch provides metrics, logs, alarms, and monitoring information that help identify performance, application, and infrastructure problems. We can analyze these details to find the root cause of an issue.

Simple ga gurthupettuko:
Problem vaste Metrics → Logs → Alarms check chesi issue identify chestham.
Eng: CloudWatch helps troubleshoot issues using metrics, logs, and alarms.

19.What is the difference between CloudWatch and CloudTrail?
CloudWatch is mainly used for monitoring performance, metrics, logs, and operational health. CloudTrail is mainly used to record AWS API activity and account actions.
Simple ga gurthupettuko:
CloudWatch monitoring kosam, CloudTrail AWS API activity tracking kosam use chestham.
Eng: CloudWatch is for monitoring, while CloudTrail is for recording AWS API activity.

20.What is the most important thing to remember about CloudWatch?
CloudWatch is mainly used to monitor and observe AWS resources, applications, and services using metrics, logs, alarms, dashboards, and other monitoring features. The important concepts are Dashboards, Metrics, Alarms, Log Groups, Log Streams, Logs Insights, Synthetics, Application Signals, Network Monitoring, and Settings.
Simple ga gurthupettuko:
CloudWatch ante AWS resources and applications ni monitor, troubleshoot, and alert cheyyadaniki use chese service.
Eng: CloudWatch is used to monitor, troubleshoot, and alert on AWS resources and applications.
