AWS Transit Gateway — Important Interview Questions & Answers

1.What is AWS Transit Gateway?
AWS Transit Gateway is a managed service used to connect multiple VPCs and on-premises networks through a central network hub.
It simplifies network connectivity by avoiding many individual connections between VPCs.
Simple ga gurthupettuko:
Transit Gateway ante multiple VPCs and on-premises networks ni central hub dwara connect cheyyadaniki use chestham.
Eng: Transit Gateway is a central hub used to connect multiple VPCs and networks.

2.Why do we use Transit Gateway?
We use Transit Gateway to simplify connectivity between multiple VPCs and on-premises networks.
Instead of creating separate connections between every VPC, we can connect them through one central Transit Gateway.
Simple ga gurthupettuko:
Multiple VPCs ni easy ga central hub dwara connect cheyyadaniki Transit Gateway use chestham.
Eng: Transit Gateway simplifies connectivity between multiple VPCs and networks.

3.What is a Transit Gateway Attachment?
An Attachment connects a network resource to a Transit Gateway.
Common attachments include VPCs and other supported network connections.
Simple ga gurthupettuko:
Attachment ante VPC or network ni Transit Gateway ki connect chese connection.
Eng: A Transit Gateway Attachment connects a network resource to the Transit Gateway.

4.What is a Transit Gateway Route Table?
A Transit Gateway Route Table contains routing information that determines where traffic should be forwarded.
It controls how traffic moves between connected networks through the Transit Gateway.
Simple ga gurthupettuko:
Transit Gateway Route Table ante traffic ye network ki vellalo decide chese routing table.
Eng: A Transit Gateway Route Table controls how traffic is routed between connected networks.

5.How does Transit Gateway connect multiple VPCs?
Each VPC is connected to the Transit Gateway using a VPC attachment.
Routes are then configured so that traffic can move between the required VPCs.
Simple ga gurthupettuko:
VPC → Attachment → Transit Gateway → Route Table → Another VPC.
Eng: VPCs connect to Transit Gateway through attachments and routing enables communication between them.

6.What is the difference between Transit Gateway and VPC Peering?
VPC Peering creates a direct network connection between two VPCs.
Transit Gateway acts as a central hub and can connect many VPCs and networks through a single service.
Simple ga gurthupettuko:
VPC Peering two VPCs direct connection, Transit Gateway many VPCs ki central hub.
Eng: VPC Peering connects VPCs directly, while Transit Gateway provides centralized connectivity.

7.Can Transit Gateway connect on-premises networks?
Yes. Transit Gateway can connect VPCs with on-premises networks through supported connectivity options such as AWS Site-to-Site VPN and Direct Connect.
This allows organizations to build centralized hybrid network architectures.
Simple ga gurthupettuko:
On-premises network ni VPN or Direct Connect dwara Transit Gateway ki connect cheyyachu.
Eng: Transit Gateway can connect VPCs and on-premises networks using VPN or Direct Connect.

8.What is centralized network architecture using Transit Gateway?
In a centralized architecture, multiple VPCs and network connections connect to one Transit Gateway.
The Transit Gateway acts as a central point for routing traffic between the connected networks.
Simple ga gurthupettuko:
Multiple VPCs ni one central Transit Gateway ki connect chesi network management simplify chestham.
Eng: Transit Gateway provides a centralized architecture for connecting multiple networks.

9.How would you troubleshoot Transit Gateway connectivity?
I would check the Transit Gateway attachment status, route tables, VPC route tables, security groups, and network ACLs.
I would also verify that the required routes exist in both the source and destination networks.
Simple ga gurthupettuko:
Connectivity problem vaste Attachment → TGW Route Table → VPC Route Table → SG → NACL check chestham.
Eng: I would check attachments, Transit Gateway routes, VPC routes, security groups, and network ACLs.

10.What is the most important thing to remember about Transit Gateway?
Transit Gateway is mainly used as a central networking hub for connecting multiple VPCs and on-premises networks.
The important concepts are Attachments, Route Tables, VPC connectivity, and centralized routing.
Simple ga gurthupettuko:
Transit Gateway ante multiple VPCs and networks ni central hub dwara connect chese AWS networking service.
Eng: Transit Gateway is a central hub for connecting and routing traffic between multiple networks.
