AWS Shield — Important Interview Questions & Answers

1.What is AWS Shield?
AWS Shield is a managed DDoS protection service that helps protect AWS applications from distributed denial-of-service attacks.
It provides network and transport layer protection for supported AWS resources.
Simple ga gurthupettuko:
Shield ante AWS applications ni DDoS attacks nundi protect cheyyadaniki use chese service.
Eng: AWS Shield provides managed protection against DDoS attacks.

2.What is the difference between AWS Shield Standard and Shield Advanced?
Shield Standard provides automatic protection against common network and transport layer DDoS attacks at no additional charge.
Shield Advanced provides enhanced DDoS protection, visibility, and additional features for supported resources.
Simple ga gurthupettuko:
Shield Standard basic DDoS protection, Shield Advanced advanced protection and extra features.
Eng: Shield Standard provides basic protection, while Shield Advanced provides enhanced DDoS protection.

3.What is a DDoS Attack?
A DDoS attack is an attempt to make an application or service unavailable by sending a large amount of traffic from multiple sources.
It can consume network, compute, or application resources.
Simple ga gurthupettuko:
DDoS ante multiple sources nundi huge traffic pampinchi application ni unavailable cheyyadam.
Eng: A DDoS attack attempts to make a service unavailable using large amounts of traffic.

4.Why do we use AWS Shield?
We use AWS Shield to protect applications from DDoS attacks and improve their availability.
It works with supported AWS services and provides automatic protection against common attacks.
Simple ga gurthupettuko:
DDoS attacks nundi application availability protect cheyyadaniki Shield use chestham.
Eng: AWS Shield protects applications from DDoS attacks and helps maintain availability.

5.What is the difference between AWS Shield and AWS WAF?
AWS Shield primarily provides protection against DDoS attacks.
AWS WAF filters web requests using rules to protect applications from common web attacks and unwanted traffic.
Simple ga gurthupettuko:
Shield DDoS protection kosam, WAF web request filtering kosam.
Eng: Shield focuses on DDoS protection, while WAF filters web requests.

6.How does AWS Shield work with CloudFront?
AWS Shield provides DDoS protection for CloudFront distributions.
CloudFront distributes application traffic through AWS edge locations, while Shield helps protect the distribution from DDoS attacks.
Simple ga gurthupettuko:
CloudFront tho Shield use cheste edge traffic ki DDoS protection improve avtundi.
Eng: AWS Shield helps protect CloudFront distributions from DDoS attacks.

7.What is AWS Shield Advanced?
AWS Shield Advanced provides enhanced DDoS protection and additional visibility and response capabilities for supported AWS resources.
It also provides features such as DDoS cost protection and access to AWS DDoS Response Team support under applicable conditions.
Simple ga gurthupettuko:
Shield Advanced ante enhanced DDoS protection and additional security features kosam use chestham.
Eng: Shield Advanced provides enhanced DDoS protection and additional capabilities.

8.What AWS resources can AWS Shield protect?
AWS Shield can protect supported AWS resources such as CloudFront distributions, Route 53 hosted zones, Elastic Load Balancing resources, and Elastic IP addresses.
The exact protection and features depend on the Shield offering and resource type.
Simple ga gurthupettuko:
Shield ni CloudFront, Route 53, Load Balancer, Elastic IP lanti supported resources ki use cheyyachu.
Eng: AWS Shield protects supported resources such as CloudFront, Route 53, and load balancing resources.

9.How would you protect a web application from DDoS attacks?
I would use AWS Shield for DDoS protection and AWS WAF to filter malicious web requests.
I would also use CloudFront, appropriate security controls, monitoring, and rate-based rules where required.
Simple ga gurthupettuko:
DDoS protection kosam Shield + WAF + CloudFront + Monitoring use chestham.
Eng: I would use Shield, WAF, CloudFront, and monitoring to protect a web application from DDoS attacks.

10.What is the most important thing to remember about AWS Shield?
AWS Shield is mainly used to protect AWS applications and resources from DDoS attacks.
Shield Standard provides automatic basic protection, while Shield Advanced provides enhanced protection and additional capabilities.
Simple ga gurthupettuko:
Shield ante AWS resources ni DDoS attacks nundi protect chese service.
Eng: AWS Shield provides managed DDoS protection for supported AWS resources.
