AWS SNS — Important Interview Questions & Answers

1.What is Amazon SNS?
Amazon SNS is a fully managed messaging service in AWS used to send messages and notifications to multiple subscribers.
It can be used for application notifications, alerts, and event-based messaging.
Simple ga gurthupettuko:
SNS ante AWS lo messages and notifications ni multiple users or services ki send cheyyadaniki use chese service.
Eng: SNS is a managed service used to send messages and notifications to subscribers.

2.What is an SNS Topic?
An SNS Topic is a communication channel where publishers send messages.
Subscribers connected to the topic can receive those messages.
Simple ga gurthupettuko:
Topic ante publishers messages send chese communication channel.
Eng: An SNS Topic is a channel where publishers send messages.

3.What is an SNS Subscription?
A Subscription defines how a subscriber receives messages from an SNS topic.
Subscribers can use endpoints such as email, SQS, Lambda, or HTTP/HTTPS.
Simple ga gurthupettuko:
Subscription ante Topic nundi messages evariki and ela receive avvali ani define chestundi.
Eng: A Subscription defines how subscribers receive messages from an SNS topic.

4.What is an SNS Publisher?
A Publisher is an application or AWS service that sends messages to an SNS topic.
The publisher does not need to directly communicate with every subscriber.
Simple ga gurthupettuko:
Publisher ante SNS Topic ki message send chese application or AWS service.
Eng: A Publisher sends messages to an SNS topic.

5.What is an SNS Subscriber?
A Subscriber is an endpoint that receives messages from an SNS topic.
For example, a subscriber can be an SQS queue, Lambda function, email, or HTTP endpoint.
Simple ga gurthupettuko:
Subscriber ante SNS Topic nundi messages receive chese endpoint.
Eng: A Subscriber is an endpoint that receives messages from an SNS topic.

6.How does SNS work?
A publisher sends a message to an SNS topic.
SNS then delivers the message to the subscribed endpoints.
Simple ga gurthupettuko:
Publisher → SNS Topic → Subscribers.
Eng: A publisher sends a message to a topic, and SNS delivers it to subscribers.

7.What is SNS Message Filtering?
Message Filtering allows subscribers to receive only the messages that match their filter policy.
It helps avoid sending unnecessary messages to subscribers.
Simple ga gurthupettuko:
Message Filtering ante subscriber ki required messages matrame receive ayyela filter cheyyadam.
Eng: Message Filtering allows subscribers to receive only matching messages.

8.Why do we use SNS Message Filtering?
We use message filtering when different subscribers need different types of messages from the same topic.
It reduces unnecessary message delivery to subscribers.
Simple ga gurthupettuko:
Different subscribers ki different messages kavali ante Message Filtering use chestham.
Eng: Message Filtering helps subscribers receive only the messages they need.

9.What is the difference between SNS and SQS?
SNS is mainly used to send messages or notifications to multiple subscribers.
SQS is mainly used to store messages in a queue so applications can process them later.
Simple ga gurthupettuko:
SNS messages ni distribute chestundi, SQS messages ni queue lo store chestundi.
Eng: SNS distributes messages, while SQS stores messages in a queue.

10.Can SNS send messages to SQS?
Yes. SNS can send messages to an SQS queue through a subscription.
This is commonly used to build loosely coupled and reliable applications.
Simple ga gurthupettuko:
SNS Topic nundi SQS Queue ki messages send cheyyachu.
Eng: SNS can send messages to an SQS queue through a subscription.

11.Can SNS trigger Lambda?
Yes. An SNS topic can invoke a Lambda function when a message is published.
Lambda can then process the message and perform the required action.
Simple ga gurthupettuko:
SNS message vachinappudu Lambda function trigger cheyyachu.
Eng: SNS can invoke a Lambda function when a message is published.

12.How can SNS send notifications to email?
We can create an SNS topic and add an email endpoint as a subscription.
After the subscription is confirmed, SNS can send messages to that email address.
Simple ga gurthupettuko:
SNS Topic ki email subscription add chesi email notifications send cheyyachu.
Eng: SNS can send notifications to an email subscriber.

13.What is the difference between Topic and Subscription?
A Topic is the communication channel where messages are published.
A Subscription connects an endpoint to the topic so it can receive messages.
Simple ga gurthupettuko:
Topic ante message channel, Subscription ante aa channel ki subscriber ni connect cheyyadam.
Eng: A Topic receives messages, while a Subscription connects subscribers to the topic.

14.How would you troubleshoot an SNS message delivery issue?
I would check whether the message was published to the correct topic.
Then I would check the subscription status, endpoint, permissions, and message filtering configuration.
Simple ga gurthupettuko:
SNS problem vaste Topic → Subscription → Endpoint → Permissions → Filtering check chestham.
Eng: I would check the topic, subscription, endpoint, permissions, and filtering.

15.What is the most important thing to remember about SNS?
SNS is mainly used to publish and distribute messages and notifications to multiple subscribers.
The important concepts are Topics, Subscriptions, Publishers, Subscribers, and Message Filtering.
Simple ga gurthupettuko:
SNS ante messages and notifications ni multiple subscribers ki distribute cheyyadaniki use chese AWS service.
Eng: SNS is used to publish and distribute messages and notifications to subscribers.
