AWS EventBridge — Important Interview Questions & Answers

1.What is AWS EventBridge?
AWS EventBridge is a serverless event service used to receive, filter, and route events between AWS services, applications, and other sources.
It helps applications respond automatically when something happens.
Simple ga gurthupettuko:
EventBridge ante oka event jariginappudu danini correct service ki route cheyyadaniki use chese service.
Eng: EventBridge is a serverless service used to route events between applications and AWS services.

2.What is an Event in EventBridge?
An event is a record that describes something that happened in an application or AWS environment.
For example, an EC2 state change or an object-related event can generate an event.
Simple ga gurthupettuko:
Event ante AWS lo or application lo jarigina oka activity or change.
Eng: An event describes something that happened in an application or AWS environment.

3.What is an Event Bus?
An Event Bus is a channel that receives events and routes them to the appropriate targets based on rules.
EventBridge provides event buses for receiving and processing events.
Simple ga gurthupettuko:
Event Bus ante events receive chesi rules prakaram targets ki send chese channel.
Eng: An Event Bus receives and routes events to targets based on rules.

4.What is an EventBridge Rule?
A Rule defines which events EventBridge should match and what target should receive those events.
Rules can use event patterns or schedules to trigger targets.
Simple ga gurthupettuko:
Rule ante ye event vachinappudu ye target trigger avvali ani define cheyyadam.
Eng: A Rule matches events and sends them to configured targets.

5.What is an Event Pattern?
An Event Pattern defines the conditions used to match incoming events.
When an event matches the pattern, the associated rule sends it to its configured target.
Simple ga gurthupettuko:
Event Pattern ante incoming event lo specific conditions match chesthe rule trigger avvadam.
Eng: An Event Pattern defines conditions used to match incoming events.

6.What are Targets in EventBridge?
Targets are the destinations where EventBridge sends matching events.
Examples include Lambda functions, SQS queues, SNS topics, Step Functions, and other supported services.
Simple ga gurthupettuko:
Target ante matching event vellalsina destination like Lambda, SQS, SNS.
Eng: Targets are destinations that receive matching events.

7.What are Scheduled Events?
Scheduled Events allow EventBridge rules to run targets at a specific time or recurring schedule.
They are useful for tasks that need to run automatically on a schedule.
Simple ga gurthupettuko:
Scheduled Event ante specific time or schedule prakaram automatic ga target trigger cheyyadam.
Eng: Scheduled Events trigger targets based on a defined schedule.

8.What is a Custom Event Bus?
A Custom Event Bus is an event bus created for application-specific events.
It helps separate custom application events from other event sources.
Simple ga gurthupettuko:
Custom Event Bus ante mana application-specific events kosam create chese event bus.
Eng: A Custom Event Bus is used for application-specific events.

9.What is the difference between EventBridge and SNS?
EventBridge is mainly used for event routing and filtering based on event patterns.
SNS is mainly used for publishing messages to subscribers and sending notifications.
Simple ga gurthupettuko:
EventBridge event routing/filtering kosam, SNS notifications and message publishing kosam.
Eng: EventBridge focuses on event routing, while SNS focuses on message publishing and notifications.

10.What is the difference between EventBridge and SQS?
EventBridge is used to route events to different targets based on rules.
SQS is a message queue used to store messages until consumers process them.
Simple ga gurthupettuko:
EventBridge events ni route chestundi, SQS messages ni queue lo store chestundi.
Eng: EventBridge routes events, while SQS stores messages for processing.

11.How does EventBridge work?
An event is sent to an Event Bus.
A Rule matches the event and EventBridge sends the matching event to the configured Target.
Simple ga gurthupettuko:
Event → Event Bus → Rule → Target.
Eng: EventBridge receives an event, matches a rule, and sends it to the target.

12.How would you trigger a Lambda function using EventBridge?
I would create an EventBridge Rule with the required event pattern or schedule.
Then I would configure the Lambda function as the target and provide the required permissions.
Simple ga gurthupettuko:
EventBridge Rule create chesi → Lambda ni target ga configure chesi → event vachinappudu Lambda trigger chestham.
Eng: I would configure a Rule with Lambda as the target to trigger it when an event matches.

13.How would you troubleshoot an EventBridge rule?
I would check whether the event is reaching the correct Event Bus and whether the event pattern matches the event.
Then I would check the rule status, target configuration, permissions, and monitoring information.
Simple ga gurthupettuko:
EventBridge problem vaste Event → Event Bus → Rule → Pattern → Target → Permissions check chestham.
Eng: I would check the event bus, rule, event pattern, target, and permissions.

14.What is the most important thing to remember about EventBridge?
EventBridge is mainly used to detect events, filter them using rules, and route them to the required targets.
The important concepts are Events, Event Buses, Rules, Event Patterns, and Targets.
Simple ga gurthupettuko:
EventBridge ante events ni receive chesi rules prakaram correct target ki route chese service.
Eng: EventBridge receives, filters, and routes events to configured targets.
