Amazon Route 53 — Important Interview Questions & Answers

1.What is Amazon Route 53?
Amazon Route 53 is a highly available and scalable DNS service provided by AWS. It is used to connect domain names with AWS resources and other internet applications.
Simple ga gurthupettuko:
Route 53 ante domain names ni resources ki map cheyyadaniki use chese AWS DNS service.
Eng: Route 53 is a highly available and scalable DNS service in AWS.

2.What is a Hosted Zone?
A Hosted Zone is a container for records that define how traffic should be routed for a domain or subdomain. Hosted Zones can be public or private.
Simple ga gurthupettuko:
Hosted Zone ante domain ki sambandhinchina DNS records ni manage chese container.
Eng: A Hosted Zone is a container for DNS records for a domain or subdomain.

3.What is a Public Hosted Zone?
A Public Hosted Zone contains DNS records that are used to route traffic on the internet. It is used for publicly accessible domain names.
Simple ga gurthupettuko:
Public Hosted Zone ante internet lo publicly accessible domain DNS records manage chese place.
Eng: A Public Hosted Zone manages DNS records for internet-facing domains.

4.What is a Private Hosted Zone?
A Private Hosted Zone contains DNS records that are used only inside one or more associated VPCs. It is useful for internal applications and private resources.
Simple ga gurthupettuko:
Private Hosted Zone ante VPC lopala internal DNS names kosam use chese hosted zone.
Eng: A Private Hosted Zone manages DNS records for resources inside associated VPCs.

5.What are Route 53 Records?
Route 53 Records define how DNS requests for a domain or subdomain should be handled. Examples include A, AAAA, CNAME, MX, and Alias records.
Simple ga gurthupettuko:
DNS Record ante domain request vachinappudu traffic ekkadiki vellalo cheppe information.
Eng: Route 53 Records define how DNS requests should be routed.

6.What is an A Record?
An A Record maps a domain name to an IPv4 address. It is commonly used to point a domain name to a server or other resource with an IPv4 address.
Simple ga gurthupettuko:
A Record ante domain name ni IPv4 address ki map chestundi.
Eng: An A Record maps a domain name to an IPv4 address.

7.What is an AAAA Record?
An AAAA Record maps a domain name to an IPv6 address. It is used when the resource is accessed using IPv6.
Simple ga gurthupettuko:
AAAA Record ante domain name ni IPv6 address ki map chestundi.
Eng: An AAAA Record maps a domain name to an IPv6 address.

8.What is a CNAME Record?
A CNAME Record maps one domain name to another domain name. It is commonly used to create an alias for another DNS name.
Simple ga gurthupettuko:
CNAME ante oka domain name ni another domain name ki map cheyyadam.
Eng: A CNAME Record maps one domain name to another domain name.

9.What is an Alias Record?
An Alias Record is a Route 53 record that can route traffic to supported AWS resources such as Application Load Balancers, CloudFront distributions, and S3 website endpoints.
Simple ga gurthupettuko:

Alias Record ante domain ni supported AWS resource ki direct ga point cheyyadaniki use chestham.
Eng: An Alias Record routes domain traffic to supported AWS resources.

10.What are Health Checks in Route 53?
Route 53 Health Checks monitor the health and availability of endpoints. They can be used with routing policies to send traffic to healthy resources.
Simple ga gurthupettuko:
Health Check ante server or endpoint healthy ga unda leda check chese feature.
Eng: Route 53 Health Checks monitor the health of endpoints.

11.What are Traffic Policies?
Traffic Policies define how Route 53 routes DNS traffic based on configured rules and conditions. They can be used to create complex DNS routing configurations.
Simple ga gurthupettuko:
Traffic Policy ante DNS traffic ni different conditions batti ela route cheyyalo define chese policy.
Eng: Traffic Policies define how Route 53 routes DNS traffic.

12.What are Domains in Route 53?
Domains section is used to register and manage domain names through Route 53. It can be used to search for, register, and manage supported domain names.
Simple ga gurthupettuko:
Domains ante Route 53 lo domain names ni register and manage chese place.
Eng: Domains are used to register and manage domain names in Route 53.

13.What is Route 53 Resolver?
Route 53 Resolver provides DNS resolution for resources inside AWS and can also support DNS queries between AWS and on-premises environments.
Simple ga gurthupettuko:
Resolver ante AWS and on-premises environments madhya DNS queries resolve cheyyadaniki use chese service.
Eng: Route 53 Resolver provides DNS resolution for AWS and connected environments.

14.What is an Inbound Endpoint?
An Inbound Endpoint allows DNS queries from an on-premises network to be sent to DNS resolvers in a VPC through Route 53 Resolver.
Simple ga gurthupettuko:
Inbound Endpoint ante on-premises nundi VPC DNS ki queries pampinchadaniki use chestham.
Eng: An Inbound Endpoint allows on-premises DNS queries to reach VPC DNS resolvers.

15.What is an Outbound Endpoint?
An Outbound Endpoint allows DNS queries from a VPC to be forwarded to DNS resolvers in an on-premises network.
Simple ga gurthupettuko:
Outbound Endpoint ante VPC nundi on-premises DNS resolver ki queries pampinchadaniki use chestham.
Eng: An Outbound Endpoint forwards DNS queries from a VPC to on-premises DNS resolvers.

16.What are Resolver Rules?
Resolver Rules define how DNS queries should be forwarded from a VPC to specific DNS servers or endpoints. They are useful for controlling DNS resolution between AWS and on-premises networks.
Simple ga gurthupettuko:
Resolver Rule ante DNS query ni specific DNS server ki ekkadiki forward cheyyalo define chese rule.
Eng: Resolver Rules define how DNS queries are forwarded to specific DNS servers.

17.What is Simple Routing Policy?
Simple Routing Policy routes traffic to a single resource or set of resources without advanced routing conditions. It is useful for basic DNS routing.
Simple ga gurthupettuko:
Simple Routing ante basic DNS routing kosam simple ga traffic ni resource ki pampinchadam.
Eng: Simple Routing Policy provides basic DNS routing to a resource.

18.What is Weighted Routing Policy?
Weighted Routing Policy distributes DNS traffic between multiple resources based on assigned weights. It is useful for testing, gradual deployments, and traffic distribution.

Simple ga gurthupettuko:
Weighted Routing ante percentage or weight basis meeda traffic ni multiple resources ki distribute cheyyadam.
Eng: Weighted Routing distributes DNS traffic based on assigned weights.

19.What is Latency Routing Policy?
Latency Routing Policy routes users to the AWS Region that provides the lowest network latency among the configured resources.
Simple ga gurthupettuko:
Latency Routing ante user ki lowest latency unna Region resource ki traffic pampinchadam.
Eng: Latency Routing sends users to the resource with the lowest network latency.

20.What is Failover Routing Policy?
Failover Routing Policy routes traffic to a primary resource and automatically uses a secondary resource when the primary resource is unhealthy.
Simple ga gurthupettuko:
Failover Routing ante primary resource fail ayite secondary resource ki traffic pampinchadam.
Eng: Failover Routing sends traffic to a secondary resource when the primary is unhealthy.

21.What is Geolocation Routing Policy?
Geolocation Routing Policy routes traffic based on the geographic location of the user. It can be used to provide different resources to users from different locations.
Simple ga gurthupettuko:
Geolocation Routing ante user location batti traffic ni different resources ki route cheyyadam.
Eng: Geolocation Routing routes traffic based on the user's geographic location.

22.What is the difference between Public and Private Hosted Zone?
A Public Hosted Zone is used for DNS records that are accessible through the internet. A Private Hosted Zone is used for DNS records that are accessible only within associated VPCs.
Simple ga gurthupettuko:
Public Hosted Zone internet kosam, Private Hosted Zone VPC internal DNS kosam use chestham.
Eng: Public Hosted Zones are for internet DNS, while Private Hosted Zones are for VPC internal DNS.

23.How does Route 53 resolve a domain name?
When a user requests a domain name, DNS resolution looks up the corresponding Route 53 record and returns the required destination information such as an IP address or AWS resource endpoint.
Simple ga gurthupettuko:
User domain request chesthe Route 53 record check chesi correct destination information provide chestundi.
Eng: Route 53 resolves domain names by using DNS records to identify the destination.

24.How would you troubleshoot a Route 53 DNS issue?
I would check the Hosted Zone, DNS records, record values, routing policy, health checks, domain registration, and DNS configuration. I would also verify whether the domain is using the correct name servers.
Simple ga gurthupettuko:
Route 53 problem vaste Hosted Zone → Records → Routing Policy → Health Check → Name Servers check chestham.
Eng: For a Route 53 issue, I would check hosted zones, records, routing policies, health checks, and name servers.

25.What is the most important thing to remember about Route 53?
Route 53 is an AWS DNS service used to register domains, manage DNS records, perform health checks, and route traffic to resources based on different routing policies.
Simple ga gurthupettuko:
Route 53 ante domains, DNS records, health checks, and traffic routing manage cheyyadaniki use chese AWS service.
Eng: Route 53 is used for DNS, domain management, health checks, and traffic routing.
